cancers such as familial adenomatous polyposis (FAP) and Gardner's syndrome. The wild type APC gene (or a part of it) can be used the respontant of the restore gene function, while primers and probes detect mutations. Also APC proteins or analogues can be used to detect mutations. Also APC proteins or analogues can be administered to compensate for a defective gene, and epithelial cells, or transgenic animals carrying a mutated APC allele are useful for detecting corrior agents able to suppress tumorigenesis. This sequence represents a human familial adenomatous polyposis colinkable) protein from clone DP2.5. The gene for the protein is present on human chromosome 521 and is also referred to as adenomatous polyposis coli gene. It is a tumour suppressor gene, and mutations in this gene tumours, and especially familial adenomatous polyposis (FAP) and despecially familial adenomatous polyposis (FAP) and colorectal tumours, and especially familial adenomatous polyposis (FAP) and calculated with tumourigenesis in retinoblastoma and colorectal tumours, syndrome (GS). The protein can be used in therapy to replace lack of native functional protein and the nucleic acids can be used for gene therapy. The nucleic acids that encode them can also be used as probes and primers in detection of the cancers and predisposition to it. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

This sequence represents a human familial adenomatous polyposis coli (APC) protein isolated from 87 cDNA clones. The gene for the protein is present on human chromsome 5021 and is also referred to as adenomatous polyposis coli gene. It is a tumour suppressor gene, and mutations in this gene have been associated with tumourigenesis in retinoblastoma and colorectal tumours, and especially familial adenomatous polyposis (PAP) and Gardner's Syndrome (GS). The protein can be used in therapy to replace lack of native functional protein and the nucleic acids can be used for gene therapy. The nucleic acids that encode them can also be used as probes and primers in detection of the cancers and predisposition to it. (Updated on 25-MAR-2003 to correct PR field.)

The invention relates to a novel method for detecting Adenomatous

Polyposis Coli (APC) protein in a sample. The method involves contacting

the sample with antibodies which specifically binds to the 2813 amino

acid form of the human APC protein, or to a mutent APC protein, and

detecting an APC-antibody complex. Mutations in the APC gene play a role

in tumorigenesis, indicating that it is a tumour suppressor gene. It is

coated on chromosome 521, which corresponds to the FAP (familial

adenomatous polyposis) locus. FAP is an autosomal dominant inherited

disease in which affected individuals develop hundreds to thousands of

adenomatous polyposis in the colon and rectum, some of which progress to

malignancy. The FAP locus is often found to be deleted in sporadic (i.e.,

non-familia) adenomas and carcinomas, and chromosome 5q deletions have

also been observed in tumours of the lung, breast, colon, rectum,

con-familia) adenomas and carcinomas, and chromosome 5q deletions have

also been observed in tumours of the lung, breast, colon, rectum,

bladder, liver, sarroomas, stomach, and prostate, and in leukaemisas and

lymphomas. Although the FAP locus several other genes such as

FER, TBI, TB2, and MCC, it is thought that mutations in the APC gene play

a key role in the development of FAP and sporadic tumours. The method is

useful for detecting APC protein and its mutant forms in foeral tissue,

placental tissue amniotic fluid, blood, serum or a tumour sample. The

somatic alteration of wild-type APC genes, and for testing therapeutic

agents for the ability to suppress tumours. The present sequence

represents a 2843 amino acid splice variant of the human APC protein.

This variant is more abundant than the 2742 amino acid variant (ABB23012)
                                                                            APC gene; Adenomatous Polyposis Coli gene; human; chromosome 5q21; familial adenomatous polyposis; FAP locus; Gardner's syndrome; GS; sporadic tumour; adenoma; carcinoma; cancer; lung; breast; colon; rectum; bladder; liver; sarcoma; stomach; prostate; leukaemia; lymphoma; tumour suppressor; anti-APC antibody; detection; diagnosis; prognosis; genetic predisposition; drug screening; DP2.5; splice variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting Adenomatous Polypopsis Coli (APC) protein in a sample for diagnosing cancers, involves contacting the sample with antibodies t specifically bind to APC protein and detecting the complex formed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            99.7%; Score 14533; DB 3; Length 2843
                                          Human APC protein (splice variant 1).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                      The invention describes a transgenic Drosophila whose genome comprises allowing regulated human colon cancer gene Adenomatous Polyposis Coli (APC) allowing regulated mis-expression of the APC gene resulting in developmental abnormalities. The transgenic files are used to screen and validate efficacy of anticancer drugs, to identify new target proceins interacting with beta-catenin, genes which interact with human APC, to study the biochemical function of human APC and to identify additional components of the Drosophila Wat/Wg signalling pathway. In particular the files are used to screen potential drugs against colon cancer. This is the amino acid sequence of the human adenomatous polyposis coli (APC) protein DNA encoding which is incorporated in the transgenic flies

This sequence represents a human APC protein which is used in a method of identifying candidate drugs for use in familial adenomatous polyposis (TAPP) patients, or patients with increased risk of developing cancer. The protein can also be used to determine the presence or absence in a cell of wild type adenomatous polyposis coli (APC) gene or a downstream or protein in the APC transcription regulatory pathway. This method involves introducing a TCF-responsive reporter gene into the cell, and measuring transcription of the reporter gene where a cell which supports active downstream protein of the APC transcription regulatory pathway. The protein can also be used in a method of diagnosing cancer in a sample cancer not other cancer associated with FAP, comprising administering to the patient a polypeptide comprising a patient with colorectal comprising the beta-catenin binding site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          121 RGFVNGSRESTGYLEELEKERSLLLADLDKEEKEKDWYYAQLQNLTKRIDSLPLTENFSL 180

The present sequence is a transcriptional activation protein related to the invention. The invention relates to human Tcf-4 proteins and their corresponding cDNA molecules which encodes transcriptional activation factorization consistency to be a catenin and cativates transcription in colorectal epithelial cells. Moreover it has been found that adenomatous polyposis coli (APC) regulates this consistency are recombinant adenovirus, Ad-Mini-Me ie., APC Minus its amino- and carboxyl -terminal Ends which expresses a fusion protein, consistency fluorescent protein (GFP)/CAPC containing GFP fused to the central control apoptosis or treating colorectal cancer. These fusion proteins inducing apoptosis or treating colorectal cancer, and other cancers care useful for treating cancer, e.g. colorectal cancer, and other cancers associated with Familial Adenomatous Polyposis (FAP) or patients with increased risk of developing cancer. Human Tcf-4 cDNA provides an excellent system for screening agents for their ability to promote callivery, integration, hybridization, expression, replication or integration in cells or in an animal. It also provides methods for diagnosis cancer in a sample suspected of being neoplastic

The present sequence is a protein involved in cancer diagnosis associated with APC or beta-catenin mutations. Human Tcf-4B protein expressed in colorectal epithalium transactivates transcription when associated with beta-catenin. Adenomatous polyposis coli (APC) regulates this transcriptional activation, at least in part by binding to beta-catenin. Determining wild-type APC protein for diagnosing cancer comprises introducing a Tcf responsive reporter gene having upstream sequences of MYC into a cell and measuring transcription of the reporter gene. The candidate drug identified is useful for treating familial adenomatous polyposis patients with APC or beta-catenin mutations and patients with increased risk of developing cancers such as colorectal, thyroid, brain, medulloblastoma, desmoid tumour, osteoma, breast, head and neck
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

AAC72297 is a cDNA isolated from the human adenomatous polyposis coli AAR63507 and AAR63509. Determination of alterations in APC or its expression products, can be used for the diagnosis and prognosis of cancer e.g. colorectal, lung and breast tumours; and for determining predisposistion to certain cancers such as familial adenomatous polyposis (PAP) and Gazdner's syndrome. The wild type APC gene (or a part of it) can be used the therapeutically to restore gene function, while primers and probes derived from the cDNA (AAQ72813-400 and AAQ72811-568) can be used to detect mutations. Also APC proteins or analogues can be administered to compensate for a defective gene, and epithelial cells, or transgenic animals carrying a mutated APC allele are useful for detecting therapeutic agents able to suppress tumorigenesis. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

```
detecting somatic alteration of wild-type adenomatous polyposis coli) protein in a tumour tissue isolated from a human (the alteration indicating neoplasia of the tissue). The method of the invention is useful in diagnosis or prognosis of a neoplastic tissue of a human the method is useful in detection of genetic predisposition to cancer. The present sequence represents a peptide sequence used in the method of the
